Cavity magnetron

Erfinder: H. Gerdien

Jahr: ~1910

The cavity magnetron is a high-powered vacuum tube that generates microwaves using the interaction of a stream of electrons with a magnetic field while moving past a series of open metal cavities (cavity resonators). Electrons pass by the openings to these cavities and cause radio waves to oscillate within, similar to the way a guitar resonates sound from its sound box via the oscillation of its strings.

Anwendungsfälle

For Microwave Oven but unfortunately also for things like Active Denial Systems (Another Card)
